Example1:
Dual USB as upstream
U5 and U6 are used for upstream USB power isolation,
providing over-current and short-circuit protection.
CH213 is a low-dropout ideal diode chip with current limiting capability.
Example 2:
Dual USB as downstream
U3 and U4 are used to control the power of the USB 2.0 downstream ports.
The CH217 is a USB port power switch chip with an adjustable current limit threshold.
The #EN pin can be connected to a GPIO pin to control the VOUT output.
